Martinsried, GERMANY
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKF2); sequenced by AGOWA within the cDNA
sequencing consortium of the German Genome Project. This clone is
available at the RZPD in Berlin.

Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer claim 3: Page 79-80; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA istalf, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

The present sequence represents the full length contig of the PS108

The present sequence represents the full length contig of the contig of
gene, as represented by clone 171346IH. This clone is the contig of
gene, as represented by clone 171346IH. This clone is the contig of
coverlapping clones V71166-79. The clone sequences are PS108
gene-specific. They are used in the method of the invention. The
specification describes a method for detecting the presence of a
specification describes a method for detecting the presence of a
contacting the test sample with at least 1 PS108-specific polynucleotide
contacting the test sample with at least 1 PS108-specific polynucleotide
contacting the test sample with at least 1 ps108-specific polynucleotide
contacting the test sample with at least 1 ps108-specific polynucleotide
contacting the test sample with at least 1 ps108-specific polynucleotide
contacting the products can be used for detecting, diagnosing,
treating, or determining predisposition to diseases or conditions of
treating, or determining predisposition to diseases or conditions
the prostate such as benign prostatic hyperplasia (PBH), prostatitis,
the prostate such as benign prostatic hyperplasia (PBH), prostatitis,
prostatic intraepithalial neoplasia (PIN) and cancer. In particular the
products can be used in drug screening and gene therapy.

Tor detecting and treating prostate cancers

Coria ii, page 39; 141pp; English.

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect,

                                                                                                           volypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer Claim 3; Page 38-39; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TIGICCAGCICAGCCAGICIGICACIGCCIAIAIGGIGICIGCCGCAGGCCIGGGICIGG 1880

Claim 1, Page 39-40; 141pp; English

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2072

Polypeptides comprising immunogenic portions of prostate proteins - word in a vaccine for the treatment of prostate cancer claim 3; Page 39; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

Claim 1; Page 224; 675pp; English.
X40438 to X40715 represent 5' expressed sequence tags (ESTs) for human secreted proteins expressed in prostate, and encode the proteins given in Y11716 to Y11993 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                              2610 TATTIATITAACAAGIAGAAGGGAATCCAIIGCIAGCITITCIGIGIIGGIGICIAAIA 2669

differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular membrane, or importing a polypeptide into a polypeptide into a membrane, or importing a polypeptide into a cell. Sequence 435 Bp; 81 A, 126 C; 153 G; 69 T;

Nucleotide sequences V71166-79 represent overlapping clones comprising the sequence V71180 and the consensus sequence V71181. The sequences are $1.08 quence v71180 and the consensus sequence V71181. The sequences of a care $1.08 quence specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a carget PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, prostatic intraepithelial neoplasia (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Billing-Medel PA, Cohen M, Colpitts TL, Friedman PN, Gordon J, Granados EN, Hodges SC, Klass MR, Kratochvil JD, Roberte-Rapp L, Russell JC, Stroupe SD;

New isolated prostate-specific polynucleotides - used to develop products for the diagnosis and treatment of prostate diseases, e.g. Denign hyperplasia, prostatic or prostate cancer Claim 1; Fig 1A-E; 122pp; English.

Nucleotide sequences V71166-79 represent overlapping clones comprising the sequences V71180 and the consensus sequence V71181. The sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2326

Products for the diagnosis and treatment of prostate diseases, e.g. products for the diagnosis and treatment of prostate diseases, e.g. benign hyperplasia, prostatic or prostate cancer claim 1, Fig 1A-E; 122pp; English.

Nucleotide sequences V7186-79 represent overlapping clones comprising the sequences V7180 and the consensus sequence V7181 . The sequences V7180 and the consensus sequence V1181. The sequences of the specific They are used in the method of the invention. The specification describes a method for detecting the presence of a crarget PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target pS108 polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, products can be used in drug screening and gene. In particular the products can be used in drug screening and gene. In particular the products can be used in drug screening and gene. In particular the products can be used in drug screening and gene. Therapy.
                                                                                                                                                                                                                                                                                                     ö

New located prostate-specific polynucleotides - used to develop new new located prostate-specific polynucleotides - used to develop products for the diagnosis and treatment of prostate diseases, e.g. benign hyperplasia, prostatic or prostate cancer cancer benign hyperplasia, prostatic or prostate cancer benign hyperplasia, prostatic or prostate cancer cancer cancer sequence V71181 A.P. Sequences C.C. the sequence V71180 and the consensus sequence V71181. The sequences V71180 and the consensus sequence V71181. The sequences of a region of the sequences of the sequence V71181 and services a method for detecting the presence of a rarget PS108 polynucleotide in a test sample. The method comprises contacting the tests sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target PS108 or complement, and detecting the presence of the target PS108 or complement, and detecting the presence of the target PS108 or complement, and detecting the presence of the target PS108 or complement, and detecting the presence of the target PS108 or camplement, and detecting the presence of the target PS108 or camplement, and detecting the presence of the target PS108 or caption monitoring predisposition to diseases or conditions of treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, product of the prostatic intraepithehial neoplasia (PNN) and cancer. SHLET protein - human herpesvirus 4 (strain B95-8)

SHLET protein - human herpesvirus 4, Epstein-Barr virus
C; Species; human herpesvirus 4, Epstein-Barr virus
C; Species; human herpesvirus 4, Epstein-Barr virus
C; Species; human herpesvirus 4, Epstein-Barr virus
C; Saccession: A03742

Nature 310, 207-211, 1984

A; Title: DNA sequence and expression of the B95-8 Epstein-Barr virus genome.
A; Reference number: A3794; MUID:84270667

A; Contents: annotation; protein coding region
C; Comment: The sequence contains four perfect repeats (residues 149-273, 274-398, 399
C; Superfamily: human herpesvirus 4 BHLEI protein
   collagen alpha 1(X) chain pr collagen alpha 2(IV) chain collagen alpha 3(IV) chain
